

3D-F1E-Front End

Installation of the button extension

After installing the control board in the front end, an extension to the direction control button becomes necessary, otherwise operation is not possible.

This consists of 3 Small printed parts, which are only partially glued.

Scope of supply

Installation order:

The collar is glued into the opening with CA.

The extension is now inserted from the inside out.

Hold against it with your finger from the inside.

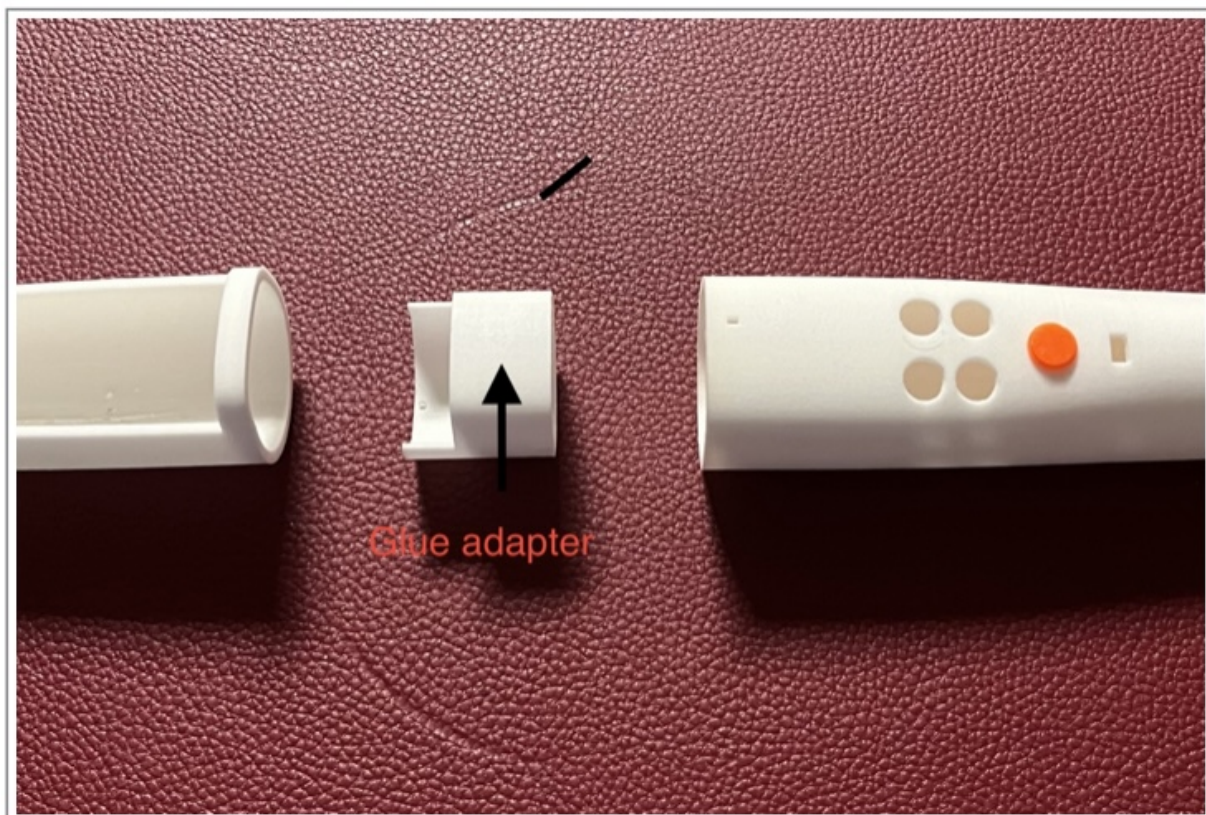

Push the lid in from the outside, glueing is not necessary. The lid sits tightly in the extension button.

Done!

To remove the board, pull the extension outwards or simply remove the board when the fuselage is turned over.

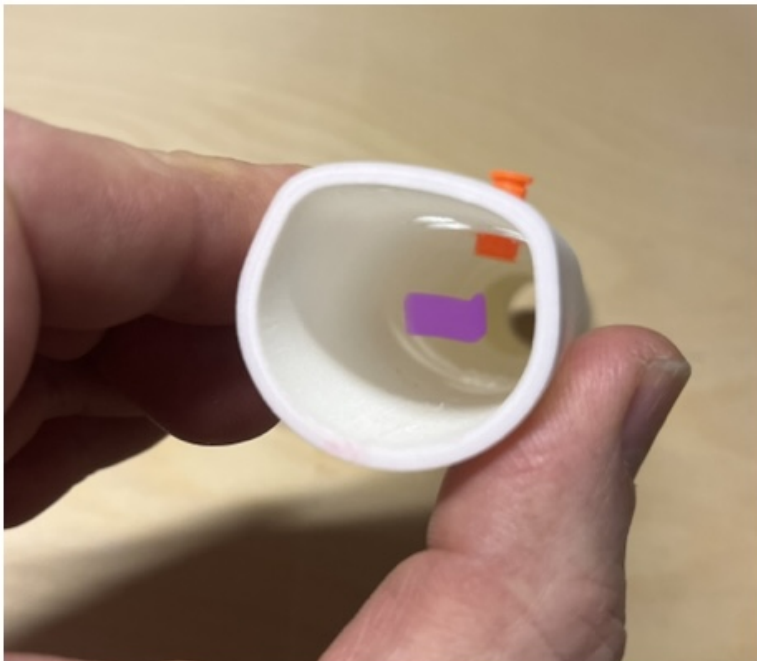

Glue - Adapter

3D-F1E-Front End Installation control board

The adhesive adapter has on the side guides for the exact horizontal positioning.

In the back Part are on the side more guide grooves.

The Insertion of the board must be by inserting the adhesive Adapter. This is important, otherwise the board will be tilted and not in the right position.

Done!

The board is inserted to the limit, the 4 openings lie exactly above the Trimm pots.

Stick order recommendation

First put the glue adapter in this position. Than only glue a few! CA only from the inside at the black line.

In the next step glue at the black marks, then put it quick together, take than CA activator.
